

45° WASHER FOR VGS

SAFETY

The VGU washer makes possible to install VGS screws at a 45° angle on steel plates. Washer marked CE as per ETA-11/0030.

PRACTICALITY

The ergonomic shape ensures a firm, precise grip during installation. Three versions of washer, compatible with VGS in diameter 9, 11 and 13 mm, are available for plates of variable thickness.

The use of the VGU allows the use of inclined screws on plate without resorting to countersunk holes on the plate, which is generally a time-consuming and costly operation.

C4 EVO COATING

VGU EVO is coated with a surface treatment resistant to high atmospheric corrosivity.

Compatible with VGS EVO diameter 9, 11 and 13 mm.

FIELDS OF USE

- timber based panels
- solid timber
- glulam (Glued Laminated Timber)
- CLT and LVL
- high density woods
- steel construction
- metal plates and profiles

Steel plate thickness ⁽²⁾	S_{PLATE}	[mm]	3,0 ÷ 12,0	4,0 ÷ 15,0	5,0 ÷ 15,0

⁽¹⁾ Pre-drilling valid for softwood.

⁽²⁾ For thicker plates than those indicated in the table it is necessary to carry out a countersink in the lower part of the steel plate. Recommended Ø5 mm guide hole (of minimum length 50 mm) for VGS screws of length $L > 300$ mm.

HELPS WITH INSTALLATION

The JIG VGU template makes it easy to prepare a 45° angle pre-drill, thus facilitating subsequent tightening of the VGS screws inside the washer. A pre-drill length of at least 20 mm is recommended.

GENERAL PRINCIPLES

- Characteristic values comply with the EN 1995:2014 standard in accordance with ETA-11/0030.
- The design sliding strength of the joint is either the timber-side design strength (R_{V,d}) and the design strength on the steel side projected (R_{tens,45,d}), whichever is lower:

$$R_{V,d} = \min \left\{ \begin{array}{l} \frac{R_{V,k} \cdot k_{mod}}{\gamma_M} \\ \frac{R_{tens,45,k}}{\gamma_{M2}} \end{array} \right.$$

- The coefficients γ_M and k_{mod} should be taken according to the current regulations used for the calculation.
- For the mechanical resistance values and the geometry of the screws, reference was made to ETA-11/0030.
- Sizing and verification of the timber elements and metal plates must be done separately.
- The screws must be positioned in accordance with the minimum distances.
- For the correct realization of the joint, the fastener head should be fully embedded into the VGU washer.
- The characteristic sliding strengths were evaluated by considering a minimum penetration length of S_g, as shown in the table, considering a minimum penetration length of 4·d₁. For intermediate values of S_g or S_{PLATE} it is possible to linearly interpolate.
- The characteristic sliding strengths were evaluated by considering an angle ϵ of 45° between the grains of the timber element and the connector.
- The VGU washer is over-resistant compared to the strength of the VGS/VGSEVO screw.
- For the calculation process a timber characteristic density $\rho_k = 385 \text{ kg/m}^3$ has been considered.

For different ρ_k values, the strength values in the table (withdrawal, compression, sliding and shear) can be converted via the k_{dens} coefficient.

$$R'_{ax,k} = k_{dens,ax} \cdot R_{ax,k}$$

ρ_k [kg/m ³]	350	380	385	405	425	430	440
C-GL	C24	C30	GL24h	GL26h	GL28h	GL30h	GL32h
k _{dens,ax}	0,92	0,98	1,00	1,04	1,08	1,09	1,11

Strength values thus determined may differ, for higher safety standards, from those resulting from an exact calculation.

- For a connection with inclined screws in a metal plate application, the characteristic effective sliding load-bearing capacity for a row of n screws is equal to:

$$R_{ef,V,k} = n_{ef,ax} \cdot R_{V,k}$$

The n_{ef} value is given in the table below as a function of n (number of screws in a row).

n	2	3	4	5	6	7	8	9	10
n _{ef,ax}	1,87	2,70	3,60	4,50	5,40	6,30	7,20	8,10	9,00

- For available VGS and VGS EVO screw sizes, see pages 164 and 180.

The use of pulse screw guns/impact wrenches is not permitted.

Ensure correct tightening. We recommend the use of torque-controlled screwdrivers, e.g. with TORQUE LIMITER. Alternatively, tighten with a torque wrench.

VGS	d ₁ [mm]	M _{ins,rec} [Nm]
Ø9	9	20
Ø11 L < 400 mm	11	30
Ø11 L ≥ 400 mm	11	40
Ø13	13	50

After installation, the fasteners can be inspected using a torque wrench.

Avoid bending.

The installation of multiple screws must be performed to guarantee that loads are distributed evenly to all fasteners.

Shrinkage or swelling of timber elements due to changes in moisture content must be avoided.

Avoid dimensional changes in the metal, e.g. due to large temperature fluctuations.

INSTALLATION WITHOUT PRE-DRILL

Place the steel plate on the wood and set the VGU washers in the slots provided.

Position the screw and respect the 45° angle of insertion.

Screw in, ensuring correct tightening.

Perform the operation for all washers. The assembly must be performed so as to guarantee that the stress is evenly distributed among all the installed VGU washers.

INSTALLATION WITH THE AID OF A PRE-DRILL TEMPLATE

Place the steel plate on the wood and set the VGU washers in the slots provided.

Use the VGU JIG template of the correct diameter by positioning it in the VGU washer

Using the pre-drill template, prepare a pre-drill/guide hole (at least 50 mm length) using an appropriate tip

Position the screw and respect the 45° angle of insertion.

Screw in, ensuring correct tightening.

Perform the operation for all washers.
The assembly must be performed so as to guarantee that the stress is evenly distributed among all the installed VGU washers.
